

CAYROS

The White Book CAYROS (CYRO)

The first token with a temporarily limited issue

1. Introduction

Welcome to the world of CAYROS, a revolutionary token, the main idea of which is to strictly time limit the issue period. We strive to solve one of the key problems of the modern crypto market: an excessive number of tokens with low or zero liquidity.

The purpose of the project:

- Creation of a token, the issue of which is limited only by a time frame.
- Ensuring the high value of each issued token by linking it to real buyers.

What makes us unique:

- Tokens are issued only at the time of purchase, which excludes the possibility of receiving them for free.
- A simple and intuitive sales system: the buyer sends the SOL to the specified address, and the tokens are automatically credited to his wallet.
- After the completion of the 200-day issue period, the issue of tokens is terminated forever.

2. Market analysis

Today, the cryptocurrency market is overflowing with tokens that have no real value or liquidity. Millions and billions of tokens are being issued without any guarantees of their use or demand. This creates problems for investors and reduces confidence in new projects.

CAYROS offers a solution to this problem:

- We have limited the issue period (200 days) and fixed the value of the token for this period. Our token can only be purchased, it cannot be obtained for free. The issue occurs at the time of purchase, which ensures that each issued token has a real buyer.
- The fixed cost of the token (1 CYRO = 0.001 SOL) during the issue ensures transparency and ease of purchase.
- The automatic sale system simplifies the token purchase process for users.

3. The technical part

CAYROS is built on the Solana blockchain, which ensures high performance, low fees and fast transactions.

Main Features:

- Token standard: SPL (Solana Program Library).
- Number of decimal places: 6.
- Mint account: 7ibm8zBrdbQkvTpAVXRw1dhMAnb56WVPvCpebNSFetDr
- Mechanics of operation:
 - The buyer sends the SOL to a special address.
 - The system automatically issues tokens and sends them to the buyer's wallet.
 - After the end of the issue period (200 days), mint account will no longer be able to issue tokens.

Technological advantages:

- The Solana blockchain provides speeds of up to 65,000 transactions per second.
- Low fees make the purchase of tokens affordable for everyone.
- High security thanks to proven Solana protocols.

4. Tokenomics

Distribution

CAYROS is unique in that it completely abandons traditional token distribution schemes. None of the issued tokens are distributed among team members, project creators, or investors.

100% of all tokens are issued only through the direct purchase system.

No ICOs, pre-sales, bonus programs, or reserves for internal use.

There is no allocation for team, marketing or other purposes.

This approach ensures that each issued token has a real owner, the person who purchased it.

Fixed cost at the time of issue 1 CYRO = 0.001 SOL

5. Road map

Q1 2025:

- Development of an automatic token sale system.
- Functional testing on the Solana testnet.

Q2 2025:

- Launch of the main network.
- Start of the issue period (200 days).

Q3 2025:

- Promotion of the project in Solana communities.
- Integration with popular DEX on Solana.

Q4 2025:

- Support for additional functions for token holders.
- Creating an ecosystem around CAYROS.

6. Applications
